

Task 3: Importing and creating Python modules and package in Python program.

Aim: To implement and demonstrate the process of importing built-in modules, creating user-defined modules, and organizing into packages; thereby promoting code reusability and maintainability.

3.1:-

1. Perform common math and random operations.
2. Work with operating System (create / change directory, list contents) and read the Python version.
3. Compute basic Statistics (mean, median, mode, standard deviation).

Algorithm:

1. Import required modules: math, random, os, sys, Pathlib.
2. math & random:
 - Compute $\sqrt{5}$; radians(30), a random float in [0,1)
 - a random integer in [2,6] (inclusive), π , ceil(2.3), floor(2.3)
 - factorial(5), gcd(5,15), abs(-10), pow(3,5), log base 3 of 2, $\log_{10}(a)$ for $a=100$, and check Nan or infinity.
- 3). OS API's:

- Create C:\PythonLab if not present and Print the current working directory.
- Create .C:\PythonLab\Lab24 if not present and change the current working directory to it.
- Print Python interpreter version.

Expected output:

-- Math & Random --

$\sqrt{5} = 2.23606797749978$

$\text{radians}(30) = 0.523598775598298$

$\text{random}() \in [0,1] = 0.37444887175646646$

$\text{randint}(2,6) = 6$ ← inclusive, will vary

$\pi = 3.141592653589793$

$\text{ceil}(2.3) = 3$

$\text{floor}(2.3) = 2$

$\text{factorial}(5) = 120$

$\text{gcd}(5,15) = 5$

$\text{abs}(-10) = 10$

$\text{pow}(3,5) = 243$

$\log_{\text{base } 3} \text{of } 2 = 0.6309297535714574$

$\log_{10}(10) = 2.0$

$\text{isinf}(\infty) = \text{True}, \text{iSnan}(\text{NaN}) = \text{True}$

Created / ensured : c:\Pythonlab

Current working directory : c:\Pythonlab (your current path)

Created / ensured & changed into c:\Pythonlab

Directory contents of C:\Pythonlab : []

Python version : 3.x.x (... details ...)

-- statistics --

$\text{mean}([5, 6, 8, 10]) = 7.25$

$\text{median}([5, 6, 8, 10]) = 7.0$

$\text{mode}([2, 5, 3, 2, 8, 3, 9, 4, 2, 5, 6]) = 2$

$\text{stdev}([2, 5, 3, 2, 8, 3, 9, 4, 2, 5, 6]) = 2.2715833383201093$

4. Statistics:

- on list [5, 6, 8, 10] and [2, 5, 3, 2, 8, 3, 9, 1, 4, 2, 5, 1, 6] compute
mean, median, mode, std.

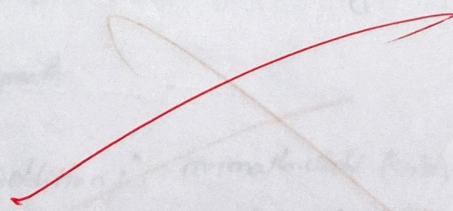

5. Print neatly formatted results.

Program:

```
import math
import random
import os
import sys
import statistics as stats
from pathlib import Path

Print("In ---MATH & RANDOM---")
Print("sqrt(5) = ", math.sqrt(5))
Print("radians(30) = ", math.radians(30))
Print("random() in [0, 1) = ", random.random())
Print("randint(2, 6) = ", math.ceil(2.3)) # random.randint(2,6)
Print("floor(2.6) = ", math.floor(2.6))
Print("Pi = ", math.pi)
Print("ceil(2.3) = ", math.ceil(2.3))
Print("floor(2.3) = ", math.floor(2.3))
Print("factorial(5) = ", math.factorial(5))
Print("gcd(5, 15) = ", math.gcd(5, 15))
Print("abs(-10) = ", abs(-10))
Print("pow(3, 5) = ", pow(3, 5))
Print("log base 3 of 2 = ", math.log(2, 3))
a_val = 100
Print(f"log 10(a_val) = ", math.log10(a_val))
int_val = float('inf')
nan_val = float("nan")
Print(f"isnan(inf) = {math.isnan(float('inf'))}, isnan(NaN) = {math.isnan(float('NaN'))}")
Print("In ---OS & SYS---")
```

```

3.3. You are tasked with developing a modular calculator application in Python. The calculator should support basic arithmetic operations: addition, subtraction, multiplication, and division. Each operation should be implemented in a separate module.

Additionally, you should create a main program to handle user input, call the appropriate module, and display the result.

Algorithm:

1. Define function for addition, subtraction, multiplication, and division.
2. Handle division by zero by raising an error if the divisor is zero.
3. Import the module (mymath) containing those functions
4. Initialize two numbers ($a=10, b=5$)
5. Call each function using mymath<function_name>(a,b)
6. Print the results of all operations

Program: (my)math

```
def add (a,b):  
    return a+b  
def subtract (a,b):  
    return a-b  
def multiply (a,b):  
    return a*b  
def divide (a,b):  
    if b==0:  
        raise ValueError ("cannot divide by zero")  
    return a/b.  
  
import mymath  
  
a = 10  
b = 5  
print ("Addition:", mymath.add (a,b))  
print ("Subtraction:", mymath.subtract(a,b))  
print ("Multiplication:", mymath.multiply (a,b))  
print ("Division:", mymath.divide (a,b))
```

3.4 You are working on a Python project that requires you to perform various mathematical operations and geometric area calculations. To organize your code better, you decide to create a package named mypackage which includes sub package Pack1 and Pack2 with two modules : mathfunction and areafunctions . Demonstrate the use of the functions by performing a few calculations and printing the results.

Algorithm:

1. Create mathfunctions.py module.
2. Create areafunctions.py module.
3. Create main.py.
4. Print the output as expected.

5. ~~Output is as follows~~ (Expected output)

Program:-

1. Create the mathfunctions.py module

```
def add(a,b):  
    return a+b  
  
def subtract(a,b):  
    return a-b  
  
def multiply(a,b):  
    if b == 0:  
        "Error! Division by zero."  
    return a*b.
```

2. Create the areafunctions.py module

```
import math  
  
def circle_area(radius):  
    return math.pi * radius * radius  
def rectangle_area(length, width):  
    return length * width  
def triangle_area(base, height):  
    return 0.5 * base * height.
```

Result:
The program successfully calculated the output as expected.

Output: $15 \times 15 = 225$

Addition: 15

Subtraction: 5

Multiplication: 50

Division: 2.0

Circle Area (radius = 7) = 153.93804002589915

Rectangle Area (5x10) = 50

Triangle Area (base = 6, height = 8) = 24.0

: (elbow + word) reso - elbow fob

3. Create the main.py file

```
import mathfunctions  
def Circle_Area(radius)  
    import areafunctions  
#using mathfunctions  
Print ("Addition:", mathfunctions.add(10,5))  
Print ("Subtraction:", mathfunctions.subtract(10,5))  
Print ("Multiplication:", mathfunctions.multiply(10,5))  
Print ("Division:", mathfunctions.divide(10,5))
```

using area functions

```
Print ("Circle Area (radius = 7)!", areafunctions.circle_area(7))  
Print ("Rectangle Area (5x10)!", areafunctions.rectangle_area(5,10))  
Print ("Triangle Area (base = 6, height = 8)!", areafunctions.triangle_area(6,8))
```

Algorithm:

1. Start

2. for adding elements to the list
and map the value to add to new values

3. for 2. Iterating over the list

4. for removing elements

5. for sorting the elements

6. for finding maximum and minimum

7. for removing elements from the list

8. for printing the elements

9. for printing the output
